
Titan Omni — Operate Your Business From Messaging

Overview

Titan Omni allows users to run their entire business from messaging platforms they already use daily.

Instead of opening dashboards, switching apps, or logging into portals, users interact with Titan through:

- WhatsApp
- Telegram
- Messenger
- SMS
- email
- voice assistants

Titan Omni becomes the universal conversational control surface for operations, finance, scheduling, customers, and automation.

Core Principle

Traditional systems require:

open dashboard → navigate menu → update record → switch tools

Titan Omni enables:

message assistant → approve action → system executes

The assistant becomes the interface.

One Assistant Everywhere

Titan Omni maintains a persistent assistant identity across channels.

Users can:

- check schedules
- send invoices
- confirm bookings
- dispatch staff
- respond to customers
- review issues
- approve automation steps

From any connected messaging platform.

No separate app required.

Messaging-Native Operations

Titan Omni supports full business workflows inside chat.

Examples:

Scheduling

“What jobs are today?”
“Reschedule Smith Street to tomorrow”
“Who is closest to the next booking?”

Finance

“Send invoice to client”
“Which invoices are overdue?”
“Remind unpaid customers”

Dispatch

“Assign cleaner to urgent job”
“Who is running late?”
“Show route gaps today”

CRM

“Show last visit details”
“Add site instruction”
“Message customer ETA”

Bring Your Own Messaging Keys

Titan Omni connects directly using user-provided credentials.

Supported providers include:

- WhatsApp Cloud API
- Telegram bot tokens
- Messenger platform apps
- SMS gateways

- email providers

Messages are not proxied through Titan infrastructure unless configured by the user.

This preserves privacy and reduces operating costs.

Customer Conversations Become Structured Workflows

Customer messages automatically convert into actions.

Example:

Customer sends:

Can I move my booking to Friday?

Titan:

- identifies booking
- proposes change
- checks availability
- confirms slot
- updates schedule
- notifies cleaner

All from one conversation.

Conversational ERP Surface

Titan Omni replaces dashboard-heavy workflows.

Users can operate:

- scheduling
- quoting
- invoicing
- issue resolution
- compliance logging
- approvals
- reporting

From chat.

This creates a conversational ERP environment.

Voice Receptionist Mode

Titan Omni can operate as a business receptionist when connected to telephony providers.

Capabilities include:

- answering calls
- capturing booking requests
- confirming appointments

- sending reminders
- collecting job details
- routing urgent issues
- handling after-hours enquiries

Voice responses use user-provided providers where configured.

Same Assistant Across Channels

Unlike traditional bots, Titan Omni maintains a unified assistant identity across:

- messaging apps
- email
- SMS
- portals
- mobile apps
- desktop environments

Meaning:

one memory

one workflow engine

one decision layer

one assistant persona

Everywhere the user works.

Multi-Role Conversations

Titan Omni adapts to different participants automatically.

Owner mode

Operational decisions

Dispatcher mode

Scheduling coordination

Cleaner mode

Shift execution guidance

Customer mode

Booking and support interface

Each role receives context-appropriate responses.

Approval-Based Automation

Titan Omni does not silently execute actions unless configured to do so.

Instead:

assistant proposes action → user approves → system executes

Examples:

- send invoice
- confirm booking

- assign staff
- escalate issue
- trigger follow-up

Maintains user control over automation.

Offline Messaging Continuity

When connectivity drops:

Titan Omni can:

- queue outgoing actions
- store incoming requests
- sync later automatically

Ensuring uninterrupted operations in field environments.

Cross-Platform Presence

Titan Omni allows businesses to operate from whichever platform they prefer.

Example workflow:

Morning:

Check jobs via WhatsApp

Afternoon:

Approve invoices via Telegram

Evening:

Respond to customer via SMS

Same assistant.

Same context.

Same memory.

Enterprise Messaging Integration

Organizations can connect internal communication systems.

Examples:

- team coordination channels
- operations alerts
- dispatch notifications
- compliance confirmations
- incident escalation flows

Titan becomes the messaging intelligence layer across the organization.

Strategic Positioning

Titan Omni is not:

a chatbot plugin

a messaging automation tool

a support bot platform

Titan Omni is:

a messaging-native business operating interface.

It allows users to run their company from the conversations they already have.

Summary

Titan Omni enables:

- business operations from messaging apps
- persistent assistant identity across channels
- conversational scheduling and dispatch
- messaging-based invoicing workflows
- receptionist voice automation
- approval-driven execution
- BYO messaging infrastructure
- privacy-first communication control

It transforms messaging into a primary business control surface.
