

TitanZero — Titan Talk Communication System

Purpose

Titan Talk is the communication interface of the TitanZero platform.

It provides a unified system for managing all customer and internal communications while maintaining direct connections to operational records such as jobs, quotes, invoices, and campaigns.

Titan Talk ensures that communication events become part of the signal-driven architecture, allowing conversations to influence automation, lifecycle assistants, and governance decisions.

Communication Philosophy

Traditional systems treat communication as separate from operations.

TitanZero integrates communication directly into operational workflows.

The guiding principle of Titan Talk is:

> Every conversation should be connected to the operational context it relates to.

This allows the system to understand the meaning of communication events and respond intelligently.

Communication Architecture

Titan Talk operates as a structured conversation system.

Conversation

Messages

Signals

Automation / AI Response

Each conversation acts as a container for messages associated with a specific customer, entity, or operational workflow.

Conversation Model

Conversations are stored in the following table:

tz_conversations

Typical fields include:

id
team_id
customer_id
subject
status
created_by
created_at
updated_at

A conversation represents an ongoing communication thread between system users and external participants.

Message Model

Individual messages are stored in:

tz_messages

Typical fields include:

id
team_id
conversation_id
sender_type
sender_id

message_body
attachments
created_at

Messages may be sent by:

customers

staff members

lifecycle assistants

automation systems

Message Types

Titan Talk supports several types of messages.

customer_message
staff_message
system_message
assistant_message

Customer Messages

Messages originating from external customers.

These messages may trigger signals such as:

message.received
customer.reply

Staff Messages

Messages sent by internal staff members through Titan Talk.

Examples include:

customer responses

scheduling updates

service confirmations

System Messages

Messages generated automatically by automation rules.

Examples include:

appointment reminders

payment confirmations

service notifications

Assistant Messages

Messages generated by lifecycle assistants through AI reasoning.

Examples include:

follow-up messages

campaign responses

operational notifications

Communication Signals

Communication activity generates signals used by other system engines.

Examples include:

message.sent
message.received
conversation.created
conversation.closed

These signals allow the system to react dynamically to communication events.

Context Linking

Conversations may be linked to operational entities through link tables.

Examples:

conversation → job
conversation → customer
conversation → invoice
conversation → campaign

This linking ensures that communications remain connected to operational context.

AI-Assisted Communication

Titan Talk integrates with lifecycle assistants to provide AI-assisted communication.

Capabilities include:

drafting message responses
summarising conversations
suggesting follow-up actions
identifying customer sentiment

These features allow operators to respond efficiently while maintaining consistent communication quality.

Lifecycle Assistant Interaction

Lifecycle assistants may interact with conversations when signals indicate relevant activity.

Example flow:

```
message.received
  ↓
context assembled
  ↓
assistant generates response suggestion
```

Operators may approve, modify, or ignore suggested responses.

Automation Integration

Automation rules may trigger communication events.

Examples include:

```
job.completed
  ↓
send follow-up message

invoice.overdue
  ↓
send payment reminder
```

This allows Titan Pulse to integrate communication directly into operational workflows.

Governance Monitoring

Certain communication events may require governance oversight.

Examples include:

- contract dispute
- refund request
- complaint escalation

These signals may be escalated to Titan Zero for evaluation.

Multi-Channel Communication

Titan Talk may integrate with external communication channels.

Possible channels include:

- email
- sms
- web chat
- social messaging

Incoming messages from these channels are converted into Titan Talk conversation messages.

Conversation Timeline

Each conversation maintains a chronological timeline of communication events.

This timeline may include:

- messages
- attachments
- related signals
- linked operational events

This provides a complete communication history for the entity involved.

Mobile Interaction

When accessed through Titan Go, Titan Talk provides simplified conversation interfaces suitable for mobile devices.

Field workers may:

view job-related messages

communicate with dispatch

send updates or evidence

Communication Auditability

All communication events are stored permanently for audit and operational review.

Records include:

message history

sender identity

timestamps

attachments

This ensures communication transparency and accountability.

Summary

Titan Talk is the unified communication system of TitanZero.

By integrating messaging directly with operational entities and system signals, Titan Talk transforms communication into a structured part of the business workflow.

This allows automation, AI reasoning, and governance systems to respond intelligently to communication events while maintaining a complete and auditable record of all interactions.
