

Titan Platform — Transform Your Service Business

Introduction

Imagine a business where every request from your team or your customers turns into action without chasing down forms or phone calls. Titan is built to make that a reality. It transforms the way service businesses run by letting you speak, type or tap your intent. Titan hears you, presents a plan and waits for your go-ahead. That means your operations are safer, faster and more predictable, from the very first day.

The Titan Edge

Most software ties you to dashboards and checklists. Titan is different. At its core is a powerful, conversation-first engine that understands natural language and translates it into real work. Whether you ask “What’s my schedule today?” or “Send an invoice to Acme Plumbing,” Titan interprets, proposes the right steps and waits for your confirmation. You stay in control—and your team gets more done.

Why It Matters

- Less noise, more action: Titan reduces context-switching and manual entry so your team can focus on customers.
- Built-in accountability: Every action follows the same flow—intent, proposal, confirmation—so nothing happens without your say-so.
- Ready for your industry: Titan adapts its language and rules for your trade, whether you’re a home services contractor, a healthcare provider or a facilities manager.

At the Heart – Titan Zero

Titan Zero is the brain behind it all. It takes requests from every channel—phone, chat, apps or external systems—and assesses them against your policies. Only after Titan Zero interprets and prepares a proposal does it ask you to approve. Because there’s a single authority, you don’t

have to worry about rogue systems or misaligned tools. Titan Zero keeps decision-making consistent, safe and auditable.

A Suite of Apps Built for Work

Titan comes with specialised apps that handle every aspect of your business. Each app is a focused tool you can pick up when you need it:

- Console offers a live feed of what's happening right now. See today's schedule, upcoming jobs and alerts without clicking through multiple screens.
- Work manages your jobs and tasks. Assign technicians, reschedule tasks and approve changes quickly—all from one place.
- People keeps your customer and team information in one source of truth. Track history, certifications and availability so you always know who's best for the job.
- Titans lets you create and manage AI agents that greet customers on web chat, answer phones or triage emails. They collect details, but you make the final call.
- Money tracks quotes, invoices and payments. Draft invoices and send them for approval; everything financial stays clear and controlled.
- Studio gives you tools to create polished documents, stunning visuals or customer portals. It's the creative engine behind your proposals and marketing.
- Marketing helps you plan campaigns and social posts. Draft, propose and schedule outreach that drives business without ever sending something you didn't approve.

These apps share data and context through Titan Zero. You can move from planning a job to invoicing a client without starting over—saving hours every week.

Voice Without the Cost

Voice is powerful for on-site technicians and quick approvals, but unmanaged, it can drive up costs. Titan caps voice sessions by default and moves conversations back to text when it makes sense. Field workers use Titan Go for quick, hands-free updates; managers have longer voice sessions in Titan Manager. You set per-user budgets and thresholds, ensuring your costs stay predictable while keeping voice available when it matters.

Seamless Connections

You already use CRM, accounting and messaging tools. Titan plays nicely with them. External systems send updates to Titan, where they become suggestions—not commands. If a payment arrives or a new customer signs up, Titan reads it, proposes the right action and waits for you to confirm. Each integration is isolated and monitored so that a problem in one system never puts your whole business at risk.

Built-in Trust and Transparency

Titan leaves nothing to guesswork. From the moment you express an intent to the final “job completed” message, every step is logged in an audit trail that cannot be tampered with. You can see who approved which invoice, why a job was rescheduled and when a customer was contacted. Titan’s design is informed by global standards in finance, healthcare and consumer protection, giving you the tools you need to meet regulatory obligations without promising compliance that isn’t yours to claim. Decision models and risk classifications are versioned, so you always know how a decision was made.

Always Resilient

Things go wrong in the real world: network outages, failed payments, miscommunication. Titan is built to handle failure gracefully. When an action cannot complete, Titan stops and tells you what happened instead of retrying in the shadows. It distinguishes between actions that can be rolled back internally, actions that require compensating steps (like issuing a refund) and actions that can’t be undone. You decide when to step in—and Titan never assumes it knows better.

Extensible and Easy to Deploy

No two businesses are alike. Titan’s extension framework lets you plug in specialised logic or external data sources without opening up your core system to risk. Extensions create proposals and insights, but they never execute actions on their own. They’re isolated, permission-scoped and can be rolled out gradually.

Deploying Titan is straightforward. Your development, staging and production environments are fully isolated, with clear promotion gates and canary releases to minimise risk. Secrets are centrally managed and rotated regularly. When new features roll out, you get them via feature flags and opt-in controls—so your team is never caught off guard.

Built to Grow with You

Titan’s roadmap isn’t about chasing the latest trend. It’s grounded in earned trust and sustainable autonomy. When the platform introduces more automation, it’s because you’ve

opted in and it has proven safe in real-world use. New industry configurations are delivered as settings files, not forks of code. AI models get smarter, but never by sacrificing predictability or auditability. That means you can adopt new capabilities at your pace, confident that they won't compromise your standards.

Pricing

Whether you're just starting out or scaling across multiple regions, Titan offers pricing that adapts to your needs:
