

PASS 1 — THE MENTAL MODEL (WHAT THIS IS)

Cleaning businesses don't fail because they can't clean.

They fail because work, communication, follow-up, and admin are fragmented across too many tools, too many decisions, and too many forgotten steps.

Jobs don't exist in isolation. A booking leads to a quote. A quote becomes a job. A job produces evidence. Evidence produces an invoice. An invoice should lead to rebooking. Most software treats these as separate features. In reality, they are one continuous lifecycle.

This system is built around that reality.

It is not a CRM.

It is not a scheduler.

It is not "AI for the sake of AI".

It is an operating system that follows work from first contact to repeat business, with one assistant that understands the entire lifecycle.

ONE ASSISTANT, ONE LIFECYCLE

There is a single Lifecycle Assistant at the centre of the system.

It does not matter whether work starts as:

- a booking,
- a quote,
- an invoice,
- or an inbound enquiry.

The assistant recognises where the work currently sits in the lifecycle and focuses only on what needs to happen next.

The lifecycle is always the same:

1. Outreach or lead intake (when enabled)
2. Booking and quote
3. Quote confirmed → job created
4. Job planning, checklists, and staff
5. Job completion, evidence, and invoicing
6. Follow-up, payment, and rebooking

The assistant does not jump ahead.

It does not overwhelm.

It stays with the work until it is finished.

HELP THAT ADAPTS TO THE USER

Not every cleaner wants the same level of help.

Some want full control.

Some want guidance.

Some want the routine handled for them.

The assistant adapts to this.

Users choose how much help they want:

- no help (manual),
- suggestions only,
- drafts prepared,
- assisted execution with approval.

The intelligence stays the same.

Only the level of execution changes.

Nothing irreversible happens without confirmation.

PACKAGES, NOT GENERIC SOFTWARE

Cleaners do not want generic tools.

They want to specialise.

Each package in the system represents a specific way of working, with its own expectations, risks, language, and client psychology.

Packages are not feature bundles.

They are behaviour profiles.

Each package defines:

- how outreach works,
- what offers are used by default,
- how strict the assistant is,
- what paperwork and evidence matter,
- how conservative automation should be.

The platform underneath is the same.

The experience is not.

THE COMMAND CENTRE

All work flows into a single dashboard.

The calendar shows the timeline of real work: bookings, jobs, follow-ups, and reminders.

The activity feed shows what needs attention now.

Notifications highlight the most important decisions.

Chat provides direct access to the assistant, always with context.

Nothing is hidden in submenus.

Nothing requires remembering what comes next.

The system surfaces only what matters at the right time.

WHAT THIS SYSTEM IS DESIGNED TO DO

This system exists to:

- make it easier to win the right clients,
- make delivery consistent and professional,
- reduce mistakes and missed steps,
- turn completed work into repeat work.

It does not promise shortcuts.

It does not replace the cleaner.

It supports the way good operators already think and work.

The result is not more software activity.

The result is predictable outcomes.

This guide explains how that works.

PASS 2 — HOW THE SYSTEM WORKS (LIFECYCLE, OFFERS, CONTROL)

The system works by treating every piece of work as a moving object through a single, predictable lifecycle. Nothing is created in isolation. Every booking, quote, job, invoice, and follow-up is part of the same flow.

The assistant's role is not to “do everything”, but to ensure the work keeps moving forward correctly.

THE CANONICAL JOB LIFECYCLE

Every package follows the same underlying lifecycle. What changes is how strict it is, how fast it moves, and what evidence is required.

The lifecycle has six phases, with an optional pre-phase.

Phase 0 — Outreach and Lead Intake (when enabled)

This phase exists only if the package supports outreach.

The assistant does not send messages itself. It decides how many new bookings are desired and hands that request to the marketing system.

Phase 1 — Booking and Quote

Details are gathered. Scope is clarified. The quote is created or confirmed.

Phase 2 — Quote Confirmed → Job

Once approved, the quote becomes a job. Nothing is re-entered. Context carries forward.

Phase 3 — Job Planning and Preparation

Checklists, staff, access notes, timing, and expectations are confirmed.

Phase 4 — Job Execution and Dispatch

Staff are dispatched. The job is completed. Progress is tracked.

Phase 5 — Completion, Evidence, and Invoicing

Evidence is reviewed. The invoice is generated. Nothing is billed without completion.

Phase 6 — Follow-Up and Rebooking

Payment is tracked. Follow-ups are prepared. Rebooking opportunities are surfaced.

The assistant never leaves the lifecycle early.

ONE ASSISTANT, SIX PHASES

There is only one Lifecycle Assistant per package.

It does not get replaced when a quote becomes a job.

It does not forget what happened earlier.

It changes mode as the work moves forward.

This is critical.

Splitting the lifecycle into separate “quote bots”, “job bots”, and “invoice bots” causes context loss, duplicated logic, and mistakes. A single assistant that follows the work prevents this.

OPINIONATED DEFAULT OFFERS

Outreach only works if the offer converts.

The system uses hard defaults based on real conversion behaviour. These defaults are pre-selected, explained, and intentionally frictionful to change.

The three default strategies are:

First Job Free (1 hour max)

Used for fast-trust, relationship-driven work.

30% off the First 5 Properties

Used for portfolio-based decision makers.

40% Introductory Trial

Used where trust, compliance, and credibility matter more than price.

These defaults exist to protect outcomes and reputation. Users can change them, but the system does not encourage experimentation at scale.

WHY DEFAULTS ARE HARD TO CHANGE

Outreach at volume amplifies mistakes.

A weak offer sent to ten people is a learning exercise.

A weak offer sent to thousands damages trust permanently.

For this reason:

- defaults are enforced by package,
- overrides require intent,
- outreach volume is throttled when offers are weakened.

The system prioritises predictable conversion over activity.

BOOKINGS PER MONTH: THE ONLY CONTROL DIAL

Users are not asked how many emails to send or messages to post.

They are asked one question:

“How many new bookings do you want per month?”

This keeps the focus on outcomes.

Each package has recommended ranges:

- high-frequency packages allow higher targets,
- high-value packages keep targets deliberately low.

The assistant uses this number to:

- calculate required lead volume,
- pace outreach safely,
- pause automatically when capacity is reached.

The user never has to manage sending limits or follow-up timing manually.

SEPARATION OF STRATEGY AND EXECUTION

The Lifecycle Assistant decides:

- whether outreach is enabled,
- the default offer,
- the booking target per month,
- when to pause or resume.

The marketing system executes:

- lead sourcing,
- messaging,
- follow-ups,
- conversations.

The assistant never sends messages directly.

The marketing system never invents strategy.

This separation prevents spam, drift, and inconsistent behaviour.

WHAT THE USER ACTUALLY EXPERIENCES

From the user's perspective:

- new bookings appear in the activity feed,

- scheduled work appears on the calendar,
- decisions appear as clear prompts,
- nothing important is missed.

The system does not ask users to manage workflows.

It reflects workflows that already exist.

This is how the lifecycle stays intact from first contact to repeat work.

PASS 3 — OFFERS, CONVERSION, AND CONTROL

Outreach only works when it is disciplined.

The system is designed to prioritise conversion quality over volume, because bad offers at scale do more damage than no outreach at all. Every decision in this pass exists to protect trust, reputation, and long-term outcomes.

WHY OUTREACH FAILS IN MOST SYSTEMS

Most outreach tools optimise for activity:

- more messages,
- more sequences,
- more automation.

They do not optimise for:

- decision-maker psychology,
- credibility signals,
- operational follow-through.

This system does the opposite.

It limits outreach unless the conditions for conversion are present.

THE THREE DEFAULT INTRO OFFERS

Each package ships with a single default offer, chosen because it converts reliably for that type of buyer.

These defaults are not marketing experiments.

They are operational strategies.

First Job Free (1 hour max)

Used where trust is personal and decisions are fast.

- Advertised as “First job free*”
- Terms are clear and limited
- Most jobs exceed one hour
- Creates time for conversation and relationship-building
- Allows quality to be demonstrated, not claimed

This offer removes friction without signalling low value.

30% off the First 5 Properties

Used where decisions are portfolio-based.

- Framed as a portfolio migration incentive
- Encourages multiple jobs immediately

- Embeds the cleaner into existing workflows
- Reduces switching risk for the client
- Maintains strong margins across volume

This offer converts relationships, not single jobs.

40% Introductory Trial

Used where credibility and compliance matter more than price.

- Signals confidence without desperation
- Avoids the risk signal of “free” work
- Fits procurement and compliance environments
- Enables a controlled trial of scope and process

This offer accelerates trust in high-stakes environments.

WHY THESE OFFERS ARE DEFAULTS

These offers are set automatically by package and are intentionally difficult to change.

The reason is simple:

- outreach scales quickly,
- reputation does not recover quickly.

Defaults exist to ensure that when outreach happens, it happens with an offer that works.

Users can override them, but the system requires intent to do so.

USER CONTROL WITHOUT CHAOS

Control is given in ways that do not undermine outcomes.

Users can:

- disable outreach entirely,
- change the booking target per month,
- choose how much assistance they want,
- review or approve messaging.

They are not asked to:

- manage daily send limits,
- tune follow-up intervals,
- design offer copy from scratch.

The system protects users from busywork that does not improve results.

CAPACITY AND SAFETY GUARDS

Outreach pauses automatically when:

- the booking target is met,
- calendar capacity is full,
- approvals are pending,

- the user disables automation.

This prevents the common failure mode of winning more work than can be delivered.

CONVERSION OVER ACTIVITY

Success is not measured by:

- messages sent,
- leads scraped,
- notifications fired.

Success is measured by:

- bookings created,
- jobs completed,
- invoices paid,
- clients rebooked.

The system optimises for the end of the lifecycle, not the beginning.

WHY THIS APPROACH WORKS

By enforcing discipline at the start:

- outreach remains credible,
- assistants remain trusted,

- results remain predictable.

The system behaves like an experienced operator, not a growth hack.

This is how conversion stays reliable as volume increases.

PASS 4 — PACKAGE PHILOSOPHY (APPLIES TO ALL FIVE)

Packages exist because cleaning businesses do not operate the same way across industries.

What works for short-stay turnover fails in medical environments.

What closes portfolio property managers fails on construction sites.

What feels efficient in commercial work feels reckless in compliance-driven work.

This system treats those differences as first-class, not configuration options.

WHAT A PACKAGE IS

A package is not a feature bundle.

A package is a behaviour profile that defines how the system thinks, recommends, and restrains itself for a specific type of work.

Each package determines:

- how outreach is allowed to operate,
- which introductory offer is used by default,
- how conservative or aggressive automation should be,
- what evidence is required before invoicing,
- what “good” performance looks like.

The underlying platform is the same.

The rules of engagement are not.

WHAT CHANGES PER PACKAGE

Each package locks in a different operating posture.

This includes:

- default offer strategy,
- booking targets per month,
- assistant strictness,
- documentation expectations,
- tolerance for automation,
- pacing of outreach.

These are not user preferences.

They are guardrails informed by how that industry actually behaves.

WHAT NEVER CHANGES

Across all packages:

- there is one lifecycle,
- one assistant follows the work,
- one calendar represents reality,
- one activity feed surfaces decisions,
- one source of truth exists for each job.

No package introduces a new workflow.

It only changes how the existing one is applied.

WHY PACKAGES ARE SEPARATE

Specialisation builds trust.

Clients do not want vendors who “do everything”.

They want vendors who understand their environment, pressures, and risks.

By separating packages:

- cleaners can present a clear professional identity,
- the system can enforce appropriate defaults,
- outcomes remain predictable.

Packages prevent users from accidentally operating with the wrong assumptions.

ADDING A PACKAGE IS ADDING A DISCIPLINE

When a user enables a package, they are not unlocking features.

They are accepting a way of working.

Each package:

- narrows choices,
- enforces discipline,
- reduces mistakes,
- increases credibility.

This is intentional.

MULTIPLE PACKAGES, SEPARATE CONTEXTS

If a user enables more than one package:

- each package runs independently,
- each has its own assistant profile,
- each has its own outreach rules,
- work never crosses contexts accidentally.

There is no blended mode.

This prevents contamination between industries with different risk profiles.

WHY THIS STRUCTURE SCALES

Because packages encode behaviour instead of settings:

- new industries can be added without rewriting the system,
- existing users are not disrupted,
- assistants remain predictable,
- the platform remains coherent.

Packages keep complexity out of the user's hands and inside the system, where it belongs.

This is what allows the platform to grow without losing trust.

PASS 5 — PACKAGE:

PREMIUM PURSUIT

Short-Stay & Airbnb Operations

WHO THIS PACKAGE IS FOR

Premium Pursuit is designed for cleaners who work in short-stay, Airbnb, and high-turnover accommodation.

This includes:

- Airbnb and short-stay hosts
- Property owners with frequent guest turnover
- Managers who prioritise speed, reliability, and presentation

These clients make fast decisions and expect consistency under time pressure.

THE REALITY OF THIS WORK

Short-stay cleaning is defined by:

- tight turnaround windows,
- frequent bookings,
- repeat work with little notice,
- high expectations on presentation.

There is little tolerance for delays or missed details.

A single failure often ends the relationship.

Trust is earned by showing up on time, doing the job well, and communicating clearly.

DEFAULT OFFER STRATEGY

First Job Free (1 hour maximum)

This offer is the default because it converts reliably in short-stay environments.

- Advertised as “First job free*”
- Limited to one hour
- Clear terms
- Labour only

Most short-stay cleans exceed one hour.

The free hour removes hesitation, creates immediate trust, and gives time to demonstrate quality.

The system strongly recommends this offer and makes it intentionally difficult to replace.

HOW OUTREACH WORKS

Outreach is fast, local, and volume-aware.

The assistant asks:

“How many new bookings do you want per month?”

Recommended range:

- 4–10 new bookings per month

Based on this target, the system:

- calculates safe outreach volume,
- paces contact automatically,
- pauses when the calendar fills.

The assistant never sends messages directly.

Outreach is executed by the marketing system using the approved offer.

HOW THE ASSISTANT BEHAVES

In Premium Pursuit, the assistant is:

- proactive,
- fast-moving,
- biased toward action.

It focuses on:

- confirming bookings quickly,
- preparing job details early,
- surfacing schedule conflicts,
- prompting rebooking immediately after completion.

Automation is more permissive here than in higher-risk packages, but approvals are always available.

WHAT A GOOD MONTH LOOKS LIKE

A healthy Premium Pursuit operation shows:

- bookings evenly distributed across the month,
- minimal gaps in the calendar,
- fast quote-to-job conversion,
- frequent rebooking from existing hosts.

The system highlights:

- under-utilised days,
- last-minute cancellations,
- missed rebooking opportunities.

WHY THIS PACKAGE PAYS FOR ITSELF

One converted host typically produces:

- recurring work,
- predictable scheduling,
- minimal sales effort after onboarding.

If the first job converts, the software has already justified its cost.

Premium Pursuit is designed to make that first conversion easy, controlled, and repeatable.

PASS 6 — PACKAGE:

COMMERCIAL CONNECTION

Offices, Facilities, Long-Term Premises

WHO THIS PACKAGE IS FOR

Commercial Connection is built for cleaners servicing offices, facilities, and long-term commercial premises.

This includes:

- office managers and facilities coordinators
- small to mid-size commercial buildings
- organisations that value reliability over novelty

These clients are not chasing the cheapest option.

They are reducing risk.

THE REALITY OF THIS WORK

Commercial cleaning is defined by:

- recurring schedules,
- predictable scope,
- long-term relationships,
- low tolerance for disruption.

Decisions are slower than short-stay, but relationships last longer.

Once trust is earned, switching rarely happens.

Failures here are not dramatic — they are administrative:

- missed cleans,
- missed details,
- missed communication.

This package is designed to prevent quiet failures.

DEFAULT OFFER STRATEGY

First Job Free (1 hour maximum)

This offer works in commercial environments because:

- it removes procurement friction,
- it creates an in-person introduction,
- it allows expectations to be aligned early.

The free hour is not positioned as a discount.

It is positioned as a risk-free trial of reliability.

As with all defaults, it is intentionally frictionful to change.

HOW OUTREACH WORKS

Outreach is deliberate and paced.

The assistant asks:

“How many new bookings do you want per month?”

Recommended range:

- 2–5 new bookings per month

Based on this target, the system:

- limits outreach volume,
- avoids over-saturation,
- prioritises consistency over speed.

Outreach pauses automatically when capacity is reached.

HOW THE ASSISTANT BEHAVES

In Commercial Connection, the assistant is:

- conservative,
- detail-oriented,
- schedule-focused.

It prioritises:

- consistent time slots,
- clear scope confirmation,
- checklist adherence,
- early detection of missed work.

Automation is allowed, but only where it reduces operational risk.

WHAT A GOOD MONTH LOOKS LIKE

A strong Commercial Connection operation shows:

- stable recurring bookings,
- minimal schedule changes,
- few escalations,
- high retention.

The system highlights:

- missed or late cleans,
- scope creep,
- opportunities to formalise recurring contracts.

WHY THIS PACKAGE PAYS FOR ITSELF

Commercial clients value continuity.

One converted commercial client often produces:

- long-term recurring revenue,
- low sales overhead,
- predictable scheduling.

Commercial Connection exists to protect those relationships by making reliability visible, measurable, and repeatable.

PASS 7 — PACKAGE:

PROPERTY PARTNERS

Property Managers & Portfolio Work

WHO THIS PACKAGE IS FOR

Property Partners is designed for cleaners who work with property managers handling multiple properties.

This includes:

- residential property managers
- agencies managing active portfolios
- teams coordinating frequent entry and exit cleans

These clients do not think in single jobs.

They think in volume, reliability, and admin efficiency.

THE REALITY OF THIS WORK

Property management cleaning is defined by:

- multiple properties at once,
- tight turnaround windows,
- strict documentation requirements,
- constant coordination with tenants, owners, and trades.

Trust is earned through consistency, communication, and paperwork done properly.

Price matters — but operational reliability matters more.

DEFAULT OFFER STRATEGY

30% off the First 5 Properties

This offer is the default because it matches how property managers decide.

- Framed as a portfolio trial
- Encourages immediate volume
- Reduces switching risk
- Embeds the cleaner into existing workflows quickly

Five properties at a reduced rate is still strong revenue, while creating long-term retention.

This offer is intentionally hard to replace.

HOW OUTREACH WORKS

Outreach targets decision-makers managing multiple properties.

The assistant asks:

“How many new portfolio relationships do you want per month?”

Recommended range:

- 2–6 new properties per month

The system:

- limits outreach volume,

- prioritises quality over quantity,
- avoids one-off landlord leads unless explicitly enabled.

Outreach pauses automatically when admin or delivery capacity is reached.

HOW THE ASSISTANT BEHAVES

In Property Partners, the assistant is:

- documentation-focused,
- deadline-aware,
- portfolio-oriented.

It prioritises:

- entry and exit reports,
- evidence collection,
- checklist consistency,
- coordination across multiple properties.

Automation is allowed, but reporting accuracy is enforced.

WHAT A GOOD MONTH LOOKS LIKE

A healthy Property Partners operation shows:

- multiple properties serviced per manager,

- predictable turnover cycles,
- low dispute rates,
- increasing portfolio share.

The system highlights:

- missed documentation,
- late reports,
- opportunities to expand within existing portfolios.

WHY THIS PACKAGE PAYS FOR ITSELF

Property managers rarely switch once trust is established.

Securing even part of a portfolio:

- generates consistent volume,
- reduces sales effort,
- compounds over time.

Property Partners is designed to make portfolio adoption smooth, controlled, and scalable.

PASS 8 — PACKAGE:

TRUSTED TRADE

Construction & Site Work

WHO THIS PACKAGE IS FOR

Trusted Trade is built for cleaners working on construction sites, renovations, and post-build projects.

This includes:

- builders and construction companies
- site managers and supervisors
- renovation and fit-out teams
- post-construction and handover cleans

These clients operate under time pressure and commercial risk.

They value reliability, speed, and competence over marketing language.

THE REALITY OF THIS WORK

Construction cleaning is defined by:

- changing schedules,
- incomplete information,
- tight deadlines,
- multiple stakeholders on site.

Jobs often change scope without notice.

Delays have knock-on effects across trades.

Trust here is earned by:

- turning up when promised,
- adapting quickly,
- documenting completion clearly,
- not creating problems on site.

DEFAULT OFFER STRATEGY

40% Introductory Trial

This offer is the default because “free” work signals inexperience on construction sites.

A strong discount:

- lowers risk for the builder,
- maintains perceived value,
- positions the cleaner as commercially realistic.

The introductory trial is:

- clearly scoped,
- time-bound,
- framed as a capability demonstration.

This offer is intentionally difficult to change.

HOW OUTREACH WORKS

Outreach is selective and relationship-driven.

The assistant asks:

“How many new construction jobs do you want per month?”

Recommended range:

- 1–3 new jobs per month

Based on this target, the system:

- limits outreach volume,
- prioritises local builders and repeat contractors,
- avoids mass prospecting.

Outreach pauses automatically if delivery capacity is constrained.

HOW THE ASSISTANT BEHAVES

In Trusted Trade, the assistant is:

- pragmatic,
- deadline-focused,
- variation-aware.

It prioritises:

- clear scope confirmation,
- rapid job readiness,

- evidence of completion,
- variation tracking when scope changes.

Automation is conservative.

Human approval is expected at key transitions.

WHAT A GOOD MONTH LOOKS LIKE

A strong Trusted Trade operation shows:

- jobs delivered on schedule,
- minimal disputes,
- clear sign-off from site managers,
- repeat work from the same builders.

The system highlights:

- scope changes,
- missed sign-offs,
- delayed invoicing.

WHY THIS PACKAGE PAYS FOR ITSELF

Construction clients reward reliability with repeat work.

One trusted relationship can produce:

- multiple sites,
- ongoing project work,
- strong referrals.

Trusted Trade exists to make professionalism visible in environments where mistakes are expensive.

PASS 9 — PACKAGE:

HIGHER CALLING

Medical & High-Compliance Environments

WHO THIS PACKAGE IS FOR

Higher Calling is designed for cleaners working in medical, health, and high-compliance environments.

This includes:

- medical clinics and practices
- allied health facilities
- diagnostic centres
- hospitals and specialist environments
- any site where hygiene, procedure, and documentation are critical

These clients are not buying cleaning.

They are buying risk reduction.

THE REALITY OF THIS WORK

Medical cleaning operates under a different set of expectations.

Work is defined by:

- strict hygiene standards
- regulated environments
- procedural consistency
- audit and compliance requirements

Trust is not built emotionally.

It is built through process, evidence, and repeatability.

A single undocumented job can undo months of good work.

DEFAULT OFFER STRATEGY

40% Introductory Trial

Free work creates uncertainty in medical environments.

A substantial but controlled discount signals confidence without compromising credibility.

The introductory trial:

- is clearly scoped
- follows full procedure
- includes documentation
- demonstrates compliance under real conditions

This offer reduces procurement friction while preserving professional positioning.

It is intentionally difficult to replace.

HOW OUTREACH WORKS

Outreach is cautious, targeted, and low volume.

The assistant asks:

“How many new medical clients do you want per month?”

Recommended range:

- 1–3 new clients per month

The system:

- limits outreach frequency
- avoids mass campaigns
- prioritises decision-makers responsible for compliance

Outreach pauses automatically if operational capacity or documentation readiness is insufficient.

HOW THE ASSISTANT BEHAVES

In Higher Calling, the assistant is:

- conservative
- compliance-first
- evidence-driven

It prioritises:

- procedure confirmation before work begins
- checklist enforcement
- mandatory evidence collection
- audit-ready records before invoicing

Automation is deliberately limited.

Human review is expected and encouraged.

WHAT A GOOD MONTH LOOKS LIKE

A healthy Higher Calling operation shows:

- consistent procedural execution
- complete documentation
- zero compliance escalations
- stable, long-term clients

The system highlights:

- missing evidence
 - incomplete checklists
 - deviations from protocol
 - upcoming compliance reviews
-

WHY THIS PACKAGE PAYS FOR ITSELF

Medical clients rarely switch providers once trust is established.

One compliant relationship can result in:

- long-term contracts
- multiple sites
- high lifetime value

Higher Calling exists to ensure that professionalism, discipline, and care are visible, provable, and repeatable in environments where failure is not an option.

PASS 10 — DEVELOPER & INTEGRATION GUIDE (DEEP-SCANNED FROM THE EXTENSION)

This chapter is based on the actual structure and code in `SocialMediaAgent_WizardUnified_v7.zip`.

10.1 Extension structure and entry points

Extension root

- `SocialMediaAgent/extension.json`

Main Service Provider

- `SocialMediaAgent/System/SocialMediaAgentServiceProvider.php`

This provider:

- registers routes
 - registers views
 - publishes assets
 - registers scheduled console commands (social post generation + analysis)
-

10.2 Route map (what exists today)

Primary authenticated user routes (under

/account/...

)

Defined in System/SocialMediaAgentServiceProvider.php:

Route group

- URL prefix: /account/dashboard/user/social-media/agent
- Route name prefix: dashboard.user.social-media.agent.

Key pages

- GET /account/dashboard/user/social-media/agent → SocialMediaAgentController@index → social-media-agent::dashboard.index
 - Route name: dashboard.user.social-media.agent.index
- GET /account/dashboard/user/social-media/agent/calendar → SocialMediaAgentController@calendar
 - Route name: dashboard.user.social-media.agent.calendar

- GET /account/dashboard/user/social-media/agent/posts → SocialMediaAgentController@posts
 - Route name: dashboard.user.social-media.agent.posts
- GET /account/dashboard/user/social-media/agent/analytics → SocialMediaAgentController@analytics
 - Route name: dashboard.user.social-media.agent.analytics
- GET /account/dashboard/user/social-media/agent/accounts → SocialMediaAgentController@accounts
 - Route name: dashboard.user.social-media.agent.accounts
- GET /account/dashboard/user/social-media/agent/agents → SocialMediaAgentController@agents
 - Route name: dashboard.user.social-media.agent.agents
- GET /account/dashboard/user/social-media/agent/chat/{id?} → SocialMediaAgentChatController@index
 - Route name: dashboard.user.social-media.agent.chat.index

Docs inside this same module

- GET /account/dashboard/user/social-media/agent/documents → SocialMediaAgentController@documents
 - Route name: dashboard.user.social-media.agent.documents.index
- POST /account/dashboard/user/social-media/agent/documents/save → SocialMediaAgentController@saveDocument
 - Route name: dashboard.user.social-media.agent.documents.save

Business Engine routes (pack-driven wizard runner)

Also defined in System/SocialMediaAgentServiceProvider.php:

- URL prefix: /dashboard/user/business-engine
- Route name prefix: dashboard.user.business-engine.
- Controller:
SocialMediaAgent/System/BusinessEngine/Controllers/BusinessEngineController.php
 - GET /dashboard/user/business-engine → index
 - GET /dashboard/user/business-engine/{pack} → run
 - POST /dashboard/user/business-engine/{pack}/submit → submit

Calendar/API endpoints used by the dashboard UI

These power the calendar and “pending count” badge updates:

- GET /account/dashboard/user/social-media/agent/api/pending-count
 - SocialMediaAgentController@getPendingCount
 - Route name: dashboard.user.social-media.agent.api.pending-count
- GET /account/dashboard/user/social-media/agent/api/posts
 - SocialMediaAgentController@getPosts
 - Route name: dashboard.user.social-media.agent.api.posts
- plus other post APIs: create/update/regenerate/generate-image, etc.

Webhook endpoint (no auth)

- POST /social-media-agent/fal-webhook (middleware api)
 - SocialMediaAgentController@falWebhook
 - Route name: dashboard.user.social-media.agent.fal-webhook
-

10.3 The dashboard and where “calendar + queue” are rendered

Dashboard view

- SocialMediaAgent/resources/views/dashboard/index.blade.php
 - includes:
 - social-media-agent::dashboard.calendar
 - social-media-agent::components.posts.carousel.posts-container
 - social-media-agent::components.edit-post-sidedrawer
 - runs a JS polling function that hits:
 - dashboard.user.social-media.agent.api.pending-count

Calendar view (FullCalendar implementation)

- SocialMediaAgent/resources/views/dashboard/calendar.blade.php

This is the key file you'll reuse for Bookings/Jobs/Invoices.

How it works today

- Initializes FullCalendar.Calendar(...)
- Uses an eventSources callback that fetches events from:
 - `route('dashboard.user.social-media.agent.api.posts')`
- It passes these query params:
 - `start_date, end_date, per_page=1000, date_column=scheduled_at`
- It expects JSON shaped like:
 - `{ success: true, posts: { data: [...] } }`
- It maps each post into a FullCalendar “allDay” event and stores details in `extendedProps`.

“Queue / feed” rendering

The feed on the dashboard is currently “posts”, rendered by:

- `social-media-agent::components.posts.carousel.posts-container`

And it’s powered by:

- `SocialMediaAgentController@index` for initial page load
- `SocialMediaAgentController@postItems` (route `post-items`) for filtered/async loading

10.4 How to hook your Cleaning Work into the calendar (the correct pattern)

You have two safe approaches:

Option A — Keep the UI intact, swap the data source

Replace the calendar's event source from "posts" to "work items".

What you change

- In resources/views/dashboard/calendar.blade.php
 - replace the fetch route:
 - from dashboard.user.social-media.agent.api.posts
 - to something like dashboard.user.business-engine.api.timeline (or a package-specific timeline endpoint)

What your new endpoint must do

Return the same kind of array FullCalendar expects, e.g.:

- id
- title
- start (date or datetime)
- allDay (true/false)
- extendedProps (anything your click/preview panel needs)

Then you can render:

- bookings as time blocks
- jobs as time blocks

- follow-ups as reminders
- invoice due dates as reminders

Option B — Don't touch the calendar view; return “post-shaped” data

If you want zero front-end changes, create an endpoint that returns:

- `{ success: true, posts: { data: [...] } }`

...but the “post” objects are actually bookings/jobs.

This is fast, but semantically messy. Option A is cleaner long-term.

10.5 How to add new “work items” into the dashboard queue/feed

Today, the dashboard feed is effectively:

- “new posts / pending posts / scheduled posts”

For cleaning operations, this becomes:

- New bookings
- Quotes awaiting approval
- Jobs needing assignment
- Jobs needing dispatch
- Jobs completed (evidence review)

- Invoices overdue (follow-up)

The pattern to follow (based on how it already works)

- Keep the “carousel + cards” layout
- Change the controller query logic
- Keep the async “postItems” style endpoint (or clone it as “workItems”)

Concretely:

- Copy the structure of `SocialMediaAgentController@postItems`
- Create a parallel method like `workItems(Request $request)`
- Filter by:
 - lifecycle phase
 - status
 - scheduled window (date range)
 - assigned staff
- Return a partial view or JSON that the existing UI can paint

10.6 Where to wire “new booking / new quote / new job / new invoice” clicks

Your extension already has a strong, consistent “route name + controller method” convention. Follow it.

Recommended additions (mirroring existing routes):

- dashboard.user.business-engine.bookings.create
- dashboard.user.business-engine.quotes.create
- dashboard.user.business-engine.jobs.create
- dashboard.user.business-engine.invoices.create

Then:

- each create action should:
 1. create the object
 2. assign lifecycle phase
 3. add a calendar entry (if time-bound)
 4. add a queue item (if attention-needed)
 5. notify the assistant layer (draft/suggest/assist depending on help level)

10.7 Chat integration points (what exists)

Chat entry is already routed here:

- dashboard.user.social-media.agent.chat.index
- Controller: System/Http/Controllers/SocialMediaAgentChatController.php

The UI button that links to chat is defined in:

- `resources/views/components/titlebar-actions.blade.php`

So when you introduce lifecycle chat (quote/job/invoice context), you can:

- keep the same chat route
- pass an optional context id (the route already allows `{id?}`)
- load thread context based on object type/id

If you later implement “case chat”:

- use the same route and map id to your lifecycle object/thread.

10.8 Notifications (what Laravel gives you, and what you can use)

The extension already has a `System/Notifications/` directory, so it's ready for standard Laravel notification patterns (database notifications for UI, plus optional channels).

In this system, notifications should come from:

- lifecycle blockers (awaiting approval)
- time triggers (dispatch soon, invoice overdue)
- exceptions (evidence missing, job failed checklist)

10.9 The key file list for devs (quick reference)

Routes

- `SocialMediaAgent/System/SocialMediaAgentServiceProvider.php`

Main dashboard

- `SocialMediaAgent/System/Http/Controllers/SocialMediaAgentController.php`
- `SocialMediaAgent/resources/views/dashboard/index.blade.php`

Calendar implementation

- `SocialMediaAgent/resources/views/dashboard/calendar.blade.php`

Business Engine (pack wizard runner)

- `SocialMediaAgent/System/BusinessEngine/Controllers/BusinessEngineController.php`

Chat entry

- `SocialMediaAgent/System/Http/Controllers/SocialMediaAgentChatController.php`
- `SocialMediaAgent/resources/views/components/titlebar-actions.blade.php`

10.10 Integration doctrine for your cleaning suite (accurate to this codebase)

If you want this extension to become the “universal add/view engine” for cleaning work:

1. Do not create a second dashboard.
 - Reuse social-media-agent::dashboard.index
2. Replace the calendar event source from posts → work timeline.
3. Replace the feed source from posts → lifecycle queue.
4. Keep chat as the universal context surface, optionally scoped by object id.
5. Keep package separation in the Business Engine, where each {pack} defines:
 - defaults (offer)
 - booking target range
 - paperwork templates
 - assistant strictness

That's how you get a unified command centre without fighting your own UI.
